1 Some Random Notes

`<hr>` is used to create a horizontal rule.

To create a link for an **email**, use the `mailto` protocol like this: `<a href="mailto: example@example.com">Send Email</a>`. When clicked, this will open the user's default email client with a new message addressed to `example@example.com`.

Similarly, for a **phone number**, use the `tel` protocol: `<a href="tel:+1234567890">Call Us</a>`. Clicking this link on a device that supports phone calls will start a call to the number +1234567890.

In `<ol>` to start numbering with 100 use `<ol start="100">`.

In tables we use `border-collapse` to collapse the borders of the table cells. This property is used to merge the borders of the table cells.
